

THE SOLAR SYSTEM

Mercury is the smallest planet I know
and it was formed many years ago.

Venus is the closest planet to the Earth
if you go there and breathe, you will find death.

The Earth is the place where we live
and it has many things to give.

Mars is also called "The Red Planet"
because it has the colour of a pomegranate.

Jupiter is the biggest planet I know
and it moves incredibly slow.

Saturn has rings
and flies without wings.

Uranus has rings as well
and this is the best I can tell.

Neptune is too far away from us
and it is made of ice and gas.

The most important star is the **Sun**
and without it we wouldn't have fun.
